Running head: INFANT POSITION IN THE HOME

1

Full-day, in home validation of infant body position measurements from inertial sensors

Full-day, in home validation of infant body position measurements from inertial sensors

Infants' movements facilitate and constrain how they interact with their surroundings from moment to moment. Changes in body position—whether infants are supine on their backs, prone on their bellies, sitting, upright, or held by a caregiver—have immediate consequences for vision, object exploration, and social interaction. When sitting and upright, infants have a better view of faces and distant objects compared to their view while in a prone position (Franchak et al., 2018; Kretch et al., 2014; Luo & Franchak, 2020). Infants struggle to manipulate objects while supine and prone, but sitting affords object exploration (Soska & Adolph, 2014). Upright walking changes how infants and caregivers interact compared with crawling in a prone position; while walking infants move farther away, share toys in different ways, and hear different language from caregivers (Chen et al., 2022; Karasik et al., 2011, 2014; West & Iverson, 2021). As infants grow older and acquire new abilities, such as independent sitting and walking, the spend more time sitting and upright and less time held, supine, and prone (Adolph & Tamis-LeMonda, 2014; Franchak et al., 2018; Franchak, 2019; Thurman & Corbetta, 2017). Thus, characterizing individual differences in the day-to-day accumulation of body position experiences informs developmental theory by revealing differential opportunities for learning.

## Goals of the Current Study

### Methods

**Participants** 

**Apparatus** 

Procedure

Body position annotation

Body position classification

### Results

Goal 1: Assess the proximal accuracy of body position classification models

Goal 2: Assess the distal accuracy of body position classification models

Goal 3: Examine the data quality of full-day home recordings

Goal 4: Assess the suitability of full-day predictions for capturing age differences in body position

Table 3

Correlations between human-coded and model-predicted body position durations across the entire long delay period. Correlations are provided within each posture and overall, and computed separately using group and individual models with and without outlier participants.

|          | With Outliers |            | Without Outliers |            |  |
|----------|---------------|------------|------------------|------------|--|
| Position | Group         | Individual | Group            | Individual |  |
| Held     | -0.03         | 0.12       | 0.55             | 0.58       |  |
| Prone    | 0.97          | 0.85       | 0.97             | 0.84       |  |
| Sitting  | 0.73          | 0.93       | 0.91             | 0.97       |  |
| Supine   | 0.84          | 0.94       | 0.94             | 0.97       |  |
| Upright  | 0.84          | 0.93       | 0.99             | 0.94       |  |
| Overall  | 0.80          | 0.91       | 0.95             | 0.96       |  |

Table 4

Correlations between human-coded and model-predicted body position durations using 10-minute bins during the distal comparison.

Correlations are provided within each posture and overall, and computed separately using group and individual models with and without outlier participants.

|          | With Outliers |            | Without Outliers |            |  |
|----------|---------------|------------|------------------|------------|--|
| Position | Group         | Individual | Group            | Individual |  |
| Held     | 0.45          | 0.43       | 0.57             | 0.55       |  |
| Prone    | 0.96          | 0.89       | 0.96             | 0.88       |  |
| Sitting  | 0.72          | 0.92       | 0.91             | 0.93       |  |
| Supine   | 0.75          | 0.95       | 0.90             | 0.94       |  |
| Upright  | 0.93          | 0.95       | 0.97             | 0.95       |  |
| Overall  | 0.80          | 0.94       | 0.93             | 0.94       |  |

Table 5
Summary of age differences in full-day body position for younger (4to 7-month) and older (11- to 14-month) infants. Values shown are
the mean percent of time for each body position averaged across
infants in each group. Standard deviations are shown in parentheses.
Descriptive statistics are shown separately for group and individual
models.

|          | Gre               | oup          | Individual        |              |  |
|----------|-------------------|--------------|-------------------|--------------|--|
| Position | Younger           | Older        | Younger           | Older        |  |
| Upright  | 7.6% (8.9)        | 18.6% (7.4)  | 9.9% (13.1)       | 18.7% (8.4)  |  |
| Sitting  | 26.3% (12.1)      | 44.4% (10.1) | $20.2\% \ (16.3)$ | 46.9% (13.3) |  |
| Prone    | $13.8\% \ (13.5)$ | 14.4% (6.0)  | 11.9% (9.9)       | 16.9% (10.6) |  |
| Supine   | 37.9% (23.2)      | 14.0% (8.4)  | 39.4% (30.3)      | 10.0% (9.5)  |  |
| Held     | 12.7% (6.9)       | 8.5% (5.4)   | 17.6% (19.9)      | 7.4% (7.6)   |  |

Figure 1. Example Timeline Caption.

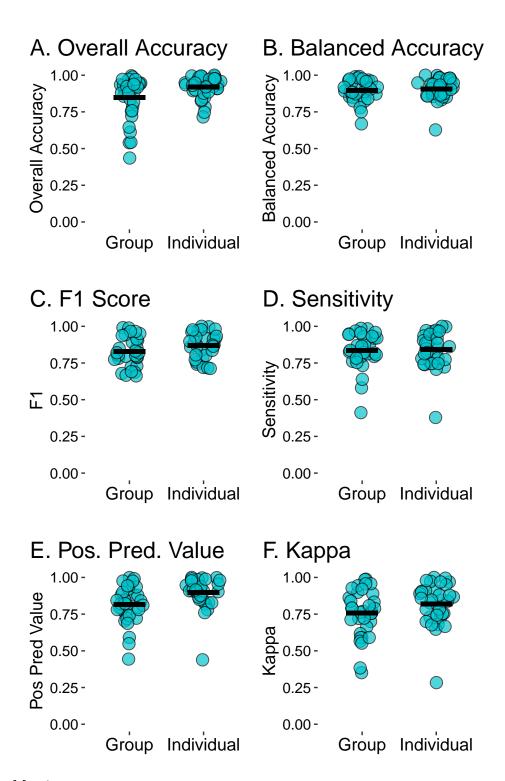

Figure 2. Metrics

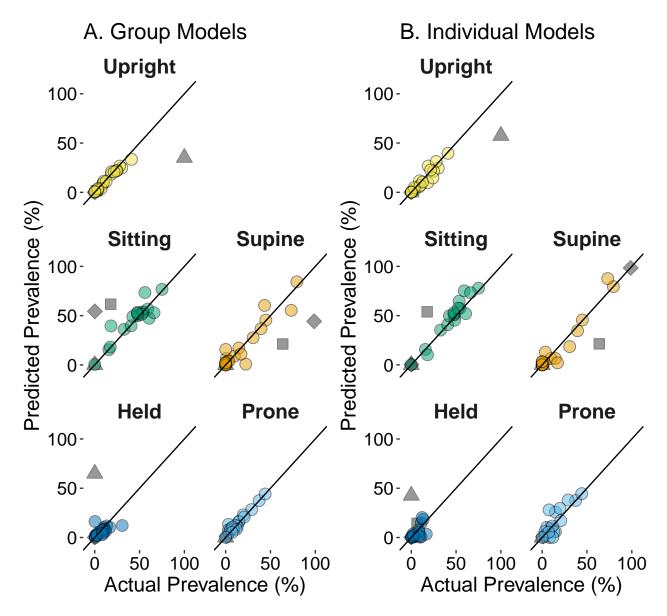

Figure 3. Overall agreement between human-coded body position and model-predicted body position in the distal comparison. Agreement for group models is shown in (A) and agreement for individual models is shown in (B). Plots are shown separately for each body position with a reference line that indicates perfect agreement; each point in a plot represent data for a single participant. The three outlier participants are plotted in dark gray, with a different shape marking each individual.

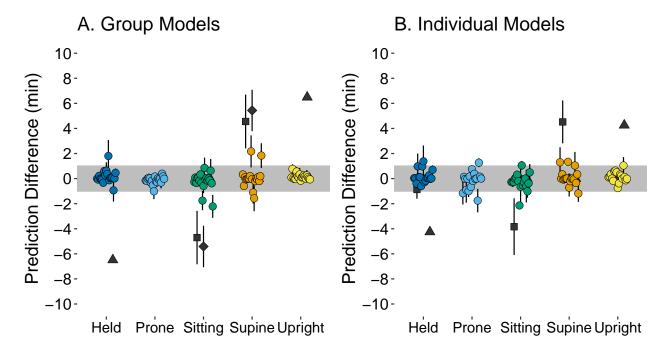

Figure 4. Prediction performance (difference in minutes between human-coded and model-predicted body position) for 10-minute bins in the distal comparison. Each point shows the mean and SE for a single participant for each body position, summarizing the prediction difference for each of their 10-minute bins. Points falling within the gray shaded region indicate that average prediction errors were less than 1 minute. Performance is plotted separately for (A) group models and (B) individual models. The three outlier participants are plotted in dark gray, with a different shape marking each individual.

Figure 5. Timelines

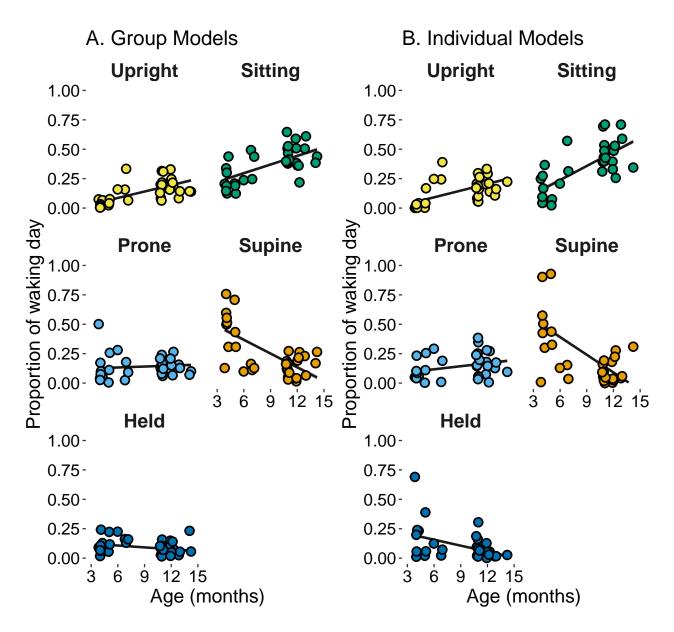

Figure 6. Age trends
